

Computer Use and Adolescent Mental Health

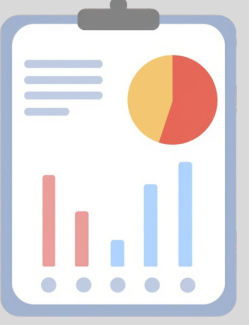

Association Between Computer Use, Sadness, and General Health

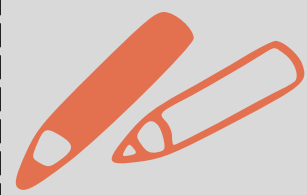

Research Question

Is computer use associated with adolescent sadness and general health?

Variables

Explanatory : Computer Use Controls : Age and Sex
Response : Sadness、General Health

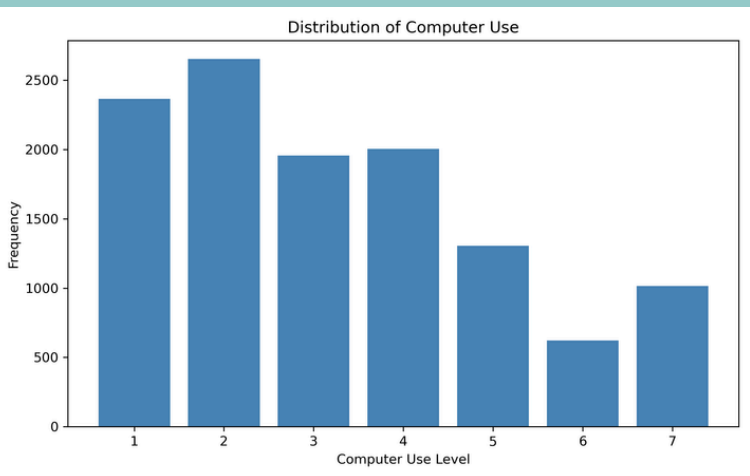

Data Cleaning

- ✓ Missing values removed
- ✓ Variables recoded
- ✓ Final sample: 11,923

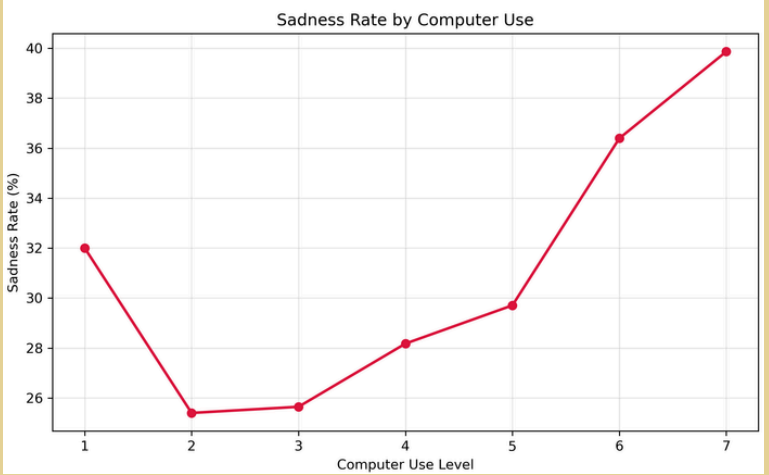

Statistical Method

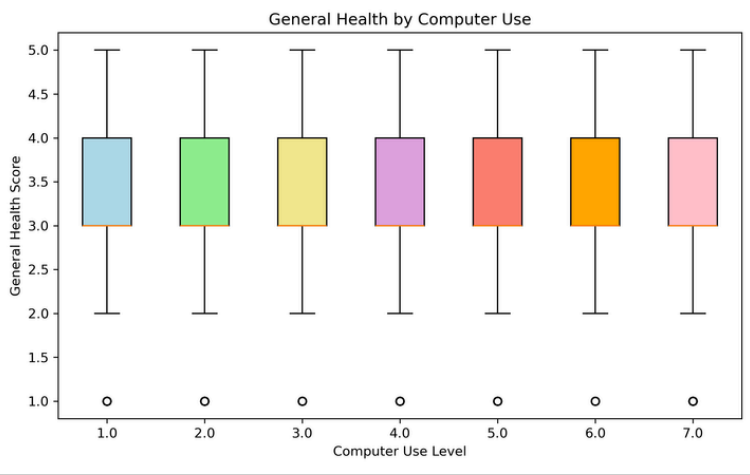

- Logistic Regression
- Adjusted for Age and Sex

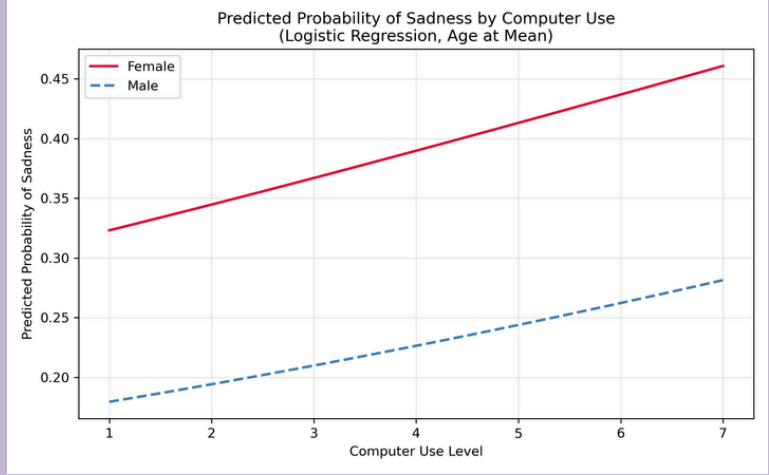

Distribution of Computer Use

Sadness Rate by Computer Use

General Health by Computer Use

Predicted Probability of Sadness

Key Findings

- 1 Higher computer use was associated with higher sadness.
- 2 Females showed higher predicted sadness probabilities.
- 3 General health remained relatively stable.

Conclusion

-  Higher computer use is associated with increased sadness.
-  General health differences are relatively small.
-  Further studies should include additional factors.
